Author Mr AndersonTamaño76 pag/ 2.6 /Intermedio FL Studio 20 Reference Tutorial FL Studio 20 Reference Tutorial If you're tempted to start using FL Studio, or are a Mac user who's only at the fold because of the latest version, then you've come to the right place. Here's the MusicTech complete guide to FL Studio! We've just reviewed FL Studio 20 and believe that it's so good that there will be many more users interested in adopting it. Not only that, but FL 20 represents the DAWs first introduction to the Mac platform, allowing there are a lot of Mac owners considering the jump too. Either way, if you're new to FL, then you've come to the right place. At first, it might seem like a tough DAW to get your head around because it does things in rather different ways to other similar software. But that's why we put this guide together. It is not necessarily aimed at newcomers to DAW music-making – although they will have advantages to follow the workshop – but more in people who cross-rating from other platforms. So if you're accustomed to using any other DAW, we'll explain how FL Studio relates to that and how its unique approach will have you make music in minutes, so let's go! The grand tour FL Studio 20 consists of five main areas, each turned on and off with five icons (the first five of the 10) in the middle of the top part of the screen. Swipe your mouse over each one and the information about it will be displayed at the top left of the screen, but we'll run through them here as they're the heart of how you make music in FL Studio. The first is the Reader that contains all the ingredients - samples, sounds, instruments, effects and so on - that you will use in your song. The second is the Channel Rack which features patterns of these beats and notes which, when compiled, hit the song arrangement. These patterns are arranged on the Playlist, the vast central area of the GUI and one other DAW users will recognize as where the song arrangement comes along. The difference is that this song arrangement is compiled with individual patterns, created in the Channel Rack, and it can exist on any track — they're not tied to one track as in most DAWs. Beat patterns tend to be created in the Channel Rack using a traditional step sequence - just highlighting the beat you want to play as it cycles around. If you want to play melodies, you still use the Channel Rack, but then use the fourth important element, the Piano Role, to play notes in traditional across a virtual keyboard (or then move in as you might on a conventional DAW). Finally, once the patterns created in the Channel Rack are arranged on the Playlist, they can be mixed with the final element, the Mixer, which can be customized in size, track colour, you name it. The workshop will show how these five main areas communicate in many more so you can understand the FL Studio way and how you can quickly start making music. We used the 'Newstuff' demo song to show you some of the features, and next time around we'll be looking at making a tune from scratch. Join us for part 2 then, and in the meantime check out our review of FL Studio 20 here. The complete guide to FL Studio 20: Step-by-step 1. Here's one of FL Studio's demo songs uploaded. Does it look quite complex? but don't worry FL Studio newbies, it can all be explained with the five icons ringed in red: the Playlist, Piano Role, Channel Rack, Mixer and Browser. 2. Click on the Browser icon (fifth from left) and the ingredients in your song will be revealed on the left side of the screen. This includes raw samples, patterns, instruments and effects. It's all on view or can be hidden inside descendants folders. You can also display user locations to show your own sample collection. 3. Here we hid all the other FL Studio details so you can see the Channel Rack, the place where all the patterns for a song are created with the elements of the browser. It's an extremely powerful device to create all the beats and melodies you can ask for. 4. Now we clicked on the first icon to show the Playlist, where the song arrangement is compiled. Other DAW users, think of it as your arrangement window, only in FL Studio you don't need to put specific data on specific tracks to enable the right sounds. 5. Returning to the Channel Rack, here's how you create a typical set of patterns, this time for a slap sound. Simply mark the beat where you want the slap to activate if it cycles around if you're playing. 6. If you want to change the sound of the slap, simply press the icon on the left (Slap 1, 2, etc.) and open a window, allowing you to change the sample, its pitch, volume of other parameters immediately. 7. For melodic patterns, you must select the Piano Role Editor (Control click on the share, or show with one of the five icon buttons – see main text) and then record or edit the notes as you would on a standard piano role editor. 8. Now you've created both beats and melody patterns that you can see each pattern within this drop-down list and also on the left side of the playlist. 9. Once you're satisfied with the Pattern(s) you created, you can now create an arrangement by simply selecting the patterns and dragging them into the Playlist wherever you want. Here we clicked on and dragged a step filter pattern. 10. Here is the final song. One thing to note that until now we've played individual patterns with the orange PAT Play icon highlighted so they play as single patterns. Now you need to click under it so that the Green SONG icon lights so skip Play will play the entire song. (See red circle on screen grab.) The final icon is the Mixer (fourth from left), left), you have not already clicked on it and all the parts can be mixed in terms of volume, panning and what effects are on each track. You can pull it to make it bigger as shown here... 12. Or adjust its width using the drop-down menu as shown here (red circle). Next time around we'll explore each of FL Studio's key features in more depth to make a tune! Click here for the latest FL Studio tutorials tutorials
