Related Articles: Now that you've had a game with shapes, including placement, rotation and measurements, it's time to create your 3D design. My controller consists of 2 stretched spheres and a flattened cylinder. (See photo) You can adjust the color, the amount of sides, the segments and the amount of bevels in the settings. I used this to make it a bit smooth and fade well. The color is not relevant at this stage other than to distinguish easily between different shapes. That's where the fun comes from: merging shapes and making holes! To merge your shapes together, select them (drag a selection around them or click one then hold the lag and click on the others you want to be selected) and click the group button that is part of a square and part of a combined circle (or press Ctrl and G together). Your shapes should all be one piece (and one color) now, but you can unbundle them by pressing the ungroup button next to the group button. PRO TIP: Ctrl Z is undo here too.... It's very convenient! To make holes (practical for yarn, buttons, nails, etc.), everything create a shape that will represent the hole you want to cut. I used bolts so I needed 4 cylindrical holes. Make sure your shapes are the correct measurements and in the right place. Then change the color of the shape to Hole (see photo), select the hole shapes and the shape you want the hole and press group! In my design, I created holes for buttons, index handles and a hole hole makeyMakey to slot in (this hole must have taken the USB port into account). Be very specific with your measurements. Hollywood has a love affair with 3D right now... but 3D isn't just for movies: video games are rapidly adopting technology, too. In fact, consumers seem more excited about 3D games than they do for 3D movies. Last year, for example, the tech blog Gizmodo enthused that 3D gaming is what will allow you to buy a new TV. It sounds breathless, but it makes sense, really: I don't remember the last time I watched TV without multitasking with a phone, laptop or tablet on my lap - and where 3D glasses don't get in the way. On the other hand, when I play, I find that 3D immerses me so much that it makes multitasking impossible, and I quickly forget the glasses that I am sucked into the 3D experience. Of course, with the game, it's no longer just about TVs: 3D can also get players to buy new computers, laptops, monitors, and more, as the craze for 3D games grows more and more in PC. On your computer, 3D game works much like any current form of 3D content: You ense a special pair of glasses that sync to the screen (whether laptop or TV). When 3D content comes into play — sometimes a special button on the laptop needs to be pressed; sometimes it's automatic — you're instantly immersed in the 3D universe. Think you'll have to wait for the content? You may be surprised to know that the games are ready and pending: All the coolest Windows games - including Portal 2, Starcraft II, and Civilization V - are already ready in 3D right out of the box. All you need is hardware (like Dell's 3D XPS 17 laptop) that can support it and a pair of 3D glasses. The future looks terribly bright for 3D games, so bright that it becomes difficult to find a new video game that doesn't support technology. Now I'm having to get some fraggng done! This story, What 3D Means for the Future of Gaming was originally published by BrandPost. Note: When you buy something after clicking on links in our articles, we can earn a small commission. Now you can watch all the 3D Blu-Rays and 3D compatible games you want, provided you're willing to set up with some really bad implementation of on a regular basis. For this reason (and because we have a nose for gimmicks) we here at GamePro remain pretty skeptical that 3D is really the future of gaming and cinematic entertainment. That said, we've actually had a couple of great experiences with playing 3D games, and if you're desperately looking for a good experience to justify this expensive 3DTV purchase, we can help. Here are five games you need to try in 3D mode if you have the equipment. Everyone uses 3D in one way -- to improve your spatial awareness, to make things more visually dramatic, or to make things feel more conveniently real -- and each of them has almost changed our view of the whole 3D or non-3D debate. Almost.Batman graphics - especially character design - already give the impression that you're playing with the coolest set of action figures ever, and the 3D effects only bring that feeling to life even more. 3D makes the action almost tactile, as if you could reach out and grab Harley Quinn and then put it on your coat. The other advantage of playing Arkham City in 3D is the best special awareness it gives, especially when you are faced with a room full of thugs and gargoyles you need to set up takedown attacks on them. The assessment of your situation, in normal or detective mode, is certainly improved by the 3D effects. The redone HD graphics for the new shadow of the Colossus version may feature cleaner lines and smoother animations than the original, but that's not quite the richly textured visual feast that the newer games have been. This does not mean that it is still not beautiful, so a little austere and austere. The addition of 3D makes this starkness stand out even more, and is somehow more effective because of it. You are even more aware of the loneliness wander and his horse Agro are in this strange country. But of course, the thing that 3D really helps to bring to life is one of the central elements that define the unique nature of the game. The colossus seem even bigger thanks to the 3D effects, giving you a better idea of the size you are when you are seized tightly turned on them. Playing in 3D only intensifies this feeling, which is one of the cornerstones of the magic of this game. Sports games seem like they would make great platforms for 3D graphics, just depending on their very nature. Sports games generally use some of the newest and most photo-realistic visuals, and the spatial nature of the sport (almost all large involves a ball and a restricted playing field) seems to be a perfect opportunity to use 3D to improve the efficiency of a game to make you feel like you really play this sport. I could have put NBA 2K12 on that list, since playing in 3D can really improve your ability to see the tracks and be aware of exactly where your teammates are. But the game that really shines in 3D is MLB 11: The Show. Just the pitcher/hitter duel alone is a completely new challenge when you have to train your eye for depth perception. MLB 11: The Show is great in 3D, but one genre, most sports games are enhanced by technology. Uncharted 3 was clearly designed around being played in 3D. Climbing and traversal puzzles clearly benefit a lot when viewed in 3D, and just the fact that the game is a third-person action game means that 3D really makes the main character Nathan Nathan stand out. As in Batman: Arkham City, you almost feel like you could reach out and touch it. But these are the scripted set pieces in Uncharted 3 where you really see how the developers built a scene with the idea in place that it would be even more awesome in 3D. Take, for example, the scene where Drake escapes from a burning cargo plane, is ejected to the rear of the fuselage and is saved by clinging to some suspended cargo nets. Now imagine it without a Subway sandwich in hand and in 3D.C's amazing. Scenes like this are more dramatic and exciting because of the extra visual dimension of 3D technology, and I think that's because they were planned that way from the beginning. Despite mixed reviews from critics, Bulletstorm had several moments of guilty fun that made it worth playing. But let-up is ultimately the reason why the game is a must-have for 3D TV owners - with the leash, the world suddenly experiences brilliant depth. The leash allows you to whip enemies towards you, then kick, throw or shoot at their vulnerable rag doll bodies. This is perhaps the biggest selling point of the game, and in 3D enemies really seem to be drawn to you or thrown away from you. Compared to 2D, the environments around the characters also seem much more realized and with real depth to them. Similarly, the iron view is greatly improved with 3D, as your gun looks like it is physically hovering over the screen. Even backgrounds, such as the occasional waterfall or cliff, really look like a part of a vast world entirely navigable in 3D. In 2D, these pieces fade in the background. With 3D, the strange world of Bulletstorm is not limited to the screaming psychos that come to you with guns.
