Read more Subletting a house or apartment can seem scary even for the most experienced renters. But subleasing the apartment is not quite rocket science, and after running ... Read more DCP Director Philip E. Castle, PhD, M.P.H. Posted on: September 11, 2020 Coming on board as Cancer Prevention Division (DCP) Director in July 2020 was a unique challenge. COVID is a serious problem at the moment, but we believe in science that will be solved soon. While cancer doesn't necessarily come out on top of people's minds during a devastating pandemic, cancer continues to kill millions of people a year. Those at risk of developing cancer rely on us to continue to innovate and try to prevent both cancer and the incompetence that accompanies it. To be here today as leader for DCP is, around, the greatest honor and privilege of my career. This is very much a home return for me. If you don't already know, I trained as a cancer prevention fellow from 1999 to 2002 and then worked in the Department of Cancer Epidemiology and Genetics until I left the NCI at the beginning of 2011. I had a great opportunity to serve at the Albert Einstein College of Medicine School/MonteFiore Medical Center in The Beranox, N.Y., which is one of the poorest urban populations in the United States. I'm both a foreigner and an outsider, and I hope we bring the best of those experiences to my new experiences. When this position was first announced, I did not immediately consider the request. As I thought more about it, I was really excited about the position prospects. What could we do to prevent cancer and improve lives? How can we apply what has been learned over the past 20 years to really have an impact on cancer nationally and internationally? This is a once-in-a-lifetime opportunity to work with you to make a lifelong impact on public health by preventing cancer and saving lives. We have a tremendous opportunity to prevent suffering and death from cancer. A DCP foundation is what I call the DCP Research and Development Pipeline: discovery, translation, early validation, and validation/effectiveness. Build off all that you have done, we will accelerate and expand our programs, and make sure your efforts make their way into clinical trials and out into the world. We should also continue to address more needs for cancer prevention, especially in those in our population who unduly load at home and abroad. Improving health equity can be achieved through the development of innovative inventions, interventions, and prevention approaches. DCP sponsors and directs groundbreaking, rigorous, collaborative research to revolutionize and accelerate cancer prevention and its consequences for all people. Science is transdisciplinary prevention. We will consider the challenges of cancer prevention by incorporating many perspectives: genetics, microbiology, clinical sciences, epidemiology, statistics, engineering, psychology, anthropology, sociology, biomedical informatics, and other disciplines. We will use every tool in our tool kit to reduce the burden of cancer. We will work even closer with our colleagues to identify and translate the best basic scientific discoveries into new preventive interventions, which if validated, then we can go hand in hand and work with other scientists to test their effectiveness on a scale and deliver these interventions to those who will benefit the most from them. Prevention, especially cancer prevention, presents unique challenges. We need to show the absence of relatively rare events (cancer) in a generally healthy population — small signal/big noise. For example, we know that if we don't do anything to prevent cervical cancer, about 1 in 50 women will develop cervical cancer in a lifetime. That is, 49 out of 50 would be perfectly fine if we left them alone. In many ways don't do harm in public health is more important than it is in medicine. For this reason, we will promote the development and validation of new prevention strategies that maximize benefits and minimize damage to the populations we serve. We cannot consider cancer prevention regardless of prevention in general since we know there is common exposure, for example, diabetes, obesity, and immunodeficiency. Impact on cancer and health in general. To that end, we will continue to work on breaking down silos and working across institutions and agencies to start new initiatives that would have thring these important causes of the disease. As Sir William Usler, one of the four founders of Johns Hopkins Hospital, stated, To prevent disease, to relieve the suffering and healing of patients - it's our job. DCP is about to prevent any next step along the continuity of cancer development, progress, and death, to prevent suffering, as well as training the next generation of scientists to continue pushing back against cancer. We will achieve this while providing good stewardesses from our resources. Cancer is a very personal disease for many people. Many of us, including me, had the lives or lives of our loved ones who had been touched by this disease. This is not an academic sport in problem solving. We are working to make the lives of people we know and love better. The best cancer is cancer that never happens. Let's go to work to make it come true. Real estate can be used for residential, commercial, or industrial purposes, and includes any resources on land such as water or minerals. Real estate is often the most valuable investment that a person owns, and the value of real estate is a key indicator of the health of an economy. Deeper defining real estate is a legal term for determining someone's rights to land and buildings. In most cases, real estate includes land plus real property, defined as local ordies where real estate exists. Land or real estate that does not belong to any property is not considered real estate. Real estate is a common form of financial investment. The land and property that someone owns can not only increase value and provide the owner with a steady profit, but also provide a steady income and even financial stability. Real estate is located in the following three categories: residential: residential property is the land used for the purpose of occupancy. It includes everything from temporary tents to mansions, and can even include portable homes such as houseboats. Many people own the house they live in revealing, but still rent out more of their homes than the real estate owner. While residential real estate does not mean providing income, it can develop equity shares over time. It is often the most valuable asset that a person owns. Commercial: Used to do business, commercial real estate is purchased with the intention of generating income. Often, this means that the real estate owner allows other businesses to rent property on their land, which provides income, but he may also own a business on his property. Industrial: Industrial real estate similar to commercial real estate is also intended Conversion of profits. Farms, mines, and land containing factories are also industrial properties. Because buying real estate is often a significant cost, many people take out loans that allow them to cover their costs and then pay it insintensible over a period of years. When buying a house, it is called a mortgage; for commercial and industrial real estate, a personal or commercial loan is required. Although it is possible to buy and sell real estate on its own, a real estate can help simplify the process. Realtors typically make a reduction of about 5 percent, but have much more first-hand knowledge of buying and selling real estate that can cost valuable. Looking to buy some real estate? The banker can help you opt out of a mortgage that will pay for your new home. For example, Gordon Real Estate owns a residential real estate project in Los Angeles. He built a large apartment building on his land. The building has 10 apartments that he rents to people and after two years already cost the construction and renovation of the structure. One of his tenants asks if he can use his apartment as a store that sells jewelry, but Gordon has to reject him because the land is not legally allowed to be used for commercial purposes. Goals.
