I first used it a few days ago when I had visitors. Surprisingly, it was spinning at 1 speed - low/slow. According to the flyer, the pan is low, medium, high and off. I can't remember if I saw a high speed/high speed when I first installed it. Nevertheless, I took the remote control back and Mgr exchanged it. I tried it again, but when I set it to high, the speed remains in low/slow motion. Is there something inside the fan that needs adjustment? If so, please share it with me. I would truly appreciate it. Thanks in advance. May 5, 2010 02:00 PM Uber members perform fans. Full-body? Make sure it is set to high. Dear New Member May 6, 2010, 06:40 AM Dear Ceiling Reading: First, thank you for your help in solving my problem. The fan has a full body. But nothing happens when you pull the fan chain. At 12:27 p.m. on May 6, 2010, an Uber member set the remote control high. Then cycle the pull-in and find the fastest speed. Report back. If you like me and have some problems with the Hampton Bay ceiling fan remote control then this is an article for you as you search for more questions. I don't claim to be an expert, but after researching a lot of articles, I've come up with a comprehensive list to solve remote control problems. These suggestions are perfectly suited to any makeup, model or brand of remote control. Here are some basics: After that we go into detail with the full description, and more so please read on. Power off /on ButtonCheck and replacement battery change dip switch settingsUniversal remote replacement method also in this article, we will cover: first, transmitter, (may be handheld or wall), transmit signal to receiver module, (located on fan). The first thing you need to do is make sure that the transmitter is receiving a signal, so that the battery is not dead. If necessary, replace it with a new control, and then try the remote control again. You need to know where the receiver position turns off the fan. Where is the Hampton Bay Fan Remote Receiver Location? Hampton Bay ceiling fan receiver position: If there is a transmitter station button, the receiver is typically located in a switch housing (between the blade and the light kit). Sometimes it can be found on the top of the motor, on the side of the motor or on the ceiling in the canopy. If the transmitter does not have a reverse button, the receiver is usually in the canopy on the ceiling. Both the receiver and transmitter must have power. Therefore, you must make sure that the wall switch is turned on before changing and testing the transmitter's battery. Always remember to turn off the power before working on the fan. Ceiling fan suddenly stops working – reset and sync! Most problems can be sorted by resetting the remote control and synchronizing it with the ceiling fan. This is called a remote reset. How should this happen? First, turn it off, turn it back on and on, and then press and hold the fan for 10 seconds within 30 seconds. This resets it. However, if it doesn't work, you may need to sync the sensor on the fan with the remote control. To do most of the remote control, use Dip Switches (check the drawings in this articleDip switch settings and check out the figure below) to set the channels of the receiver and transmitter. If you have more than one fan with a remote control, you can change the switch settings on one transmitter with that receiver so that the transmitter can only operate the ceiling fan when operating with that setting. Alternatively, if you have two or more ceiling fans in the same room and want to work together, set the receiver to the same settings, and then the transmitter set to the same setting will operate the fan. The receiver only allow signals from transmitters with the same deep switch settings. Nothing works on my Hampton Bay remote and the transmitter's little red light works with all the buttons! You need to check the Hampton Bay ceiling fan remote dip switch settings. Before you start opening the fan receiver, try these settings; If you have four dip switches, try all the switches, try #1 off, #2,3,4ON to try #1,2,3ON and try #4 off. If there are 5 dip switches; #1,2,3,4 ON and #5 off, try everything, and try off with #2,3,4 ON #5 #1. If these settings do not work, click here to see all possible dip switch settings. Try each of the different settings. If none of these settings work, the transmitter or receiver may be bad. Nothing works on my fan remote and the transmitter's little red light doesn't light up! In this case, the transmitter is most likely the worst, but you can send it for free testing before purchasing the part. See below for information on how to use free testing of transmitters. The fan works, but the light doesn't. The transmitter's red light works! Receivers are mostly bad, but you can send them for free testing before purchasing parts. See the free test below. Damon, TX 77430 - Please include a note with your name and phone number. What is the dip switch for my ceiling fan remote control? If you are like me, you may be wondering what a DIP switch is. It is actually a small set of switches in a short dual inline package or DIP that is used to change the operating mode of the ceiling fan. DIP switches are becoming less common because most ceiling fans have technology that no longer requires manual configuration. Can I add or change the IN-WALL remote control wall switch? In most cases, yes, if the fan has a handheld remote control, there is a wall switch to replace the standard wall switch. You can then control the fan function from the wall or handheld remote control. For more information, check out the post on the Hampton Bay remote. The fan works when using the remote control, but the light does not work, but the fan is a common problem and does not work at all, or the fan only works at low speed. The reason is that someone is pulling one or both full chains. In this case, the remote control does not work because the full chain switch is synchronized with the remote control receiver device. Therefore, if the full chain is in an off position, the remote control will not be able to power the ceiling fan light or fan. The solution is to press the fan high button. If this doesn't work, the problem is something else. Another thing you can try if the fan works If the light does not turn on, hold down the light button on the remote control while holding down the light chain a few times. Remember that pressing it is key. Universal Remote Replacement You can also get a good universal remote control to operate the ceiling fan if you lose the original. Just go to the Google Play Store and do a search for 'Universal Remote' or 'Ceiling Fan Remote' and download and try the app. If you like and have an app to use for Hampton Bay fans please share it with us so we can recommend it for others. The remote receiver input (wires painted red/black and white) from outlets and outputs (wires painted blue, white, and black) may have been properly connected to the fan. You can also set the same dip switch (0-0-0-0) for both the receiver and transmitter, but nothing happens when you press the remote button. You may also have tried to change the dip switch to other settings, such as 1-1-0-0, on both the limiter and receiver. Still the same thing, nothing happens. In these cases, can the transmitter or receiver be defective? Can the battery die? Before you start turning off the circuit breaker. All components must be tested with a voltage detector before the wiring can be touched. Below is a diagram of a Hampton Bay fan remote receiver wiring, this is how the fan is wired. Hampton Bay ceiling fan remote wiring diagram The next possible reason why the fan does not work is to consider remote. The red LED light lights up when the button is pressed on the remote control. This tells you that the fan remote is signaling the fan receiver. When this happens, the battery is normal and the ceiling fan remote control works the proper way. In this case, if the fan is new or still under warranty, you can use the receipt to return to the Home Depot store where you purchased the fan and receive a replacement receiver. If the fan still does not work after all of the above steps, you should get a multimeter and start testing the voltage between the white and black (or red) wires. Five of the best Hampton Bay ceiling fan universal remotes so we made sure universal remotes were available and came up with a final list of six that we considered to be the best. Some are wink activated, others are basic and some are LCD with temperature control. 1. Hampton Bay Premier Universal Ceiling Fan Remote Control Premier Universal Remote Control Premier Universal Remote Control Our first choice is Hampton Bay Premier Universal Ceiling Fan Remote Control This remote control is good for most styles of ceiling fans including Hampton Bay and Hunter. That's You can control the light on the fan with dimming and speed. It is wireless and the receiver is included in the $41.34 price. It goes well with the sleek design. Delays are a really useful feature that let you turn off light in bed, and delays are only shown after a short wait while the light goes out, so you can leave your bedroom in the light. We found that most installations are very easy without any problems. You're 4.4 stars

out of 5 stars. This remote control is not available incorrectly because it is recommended by 89% of customers. You can find it here. 2. 3-speed universal ceiling fan remote control 3 speed universal remote control again we recommend this remote control because it also has dimming function and is suitable for most ceiling fans. We found it to be easy to install and very compatible with LEDs, incandescent and CFL bulbs. Dimming lights, we use LED's, work well. When using only the universal remote control, the fan/light is switched on very immediately. Wiring is easy enough. No problems or hassles. At $34.97 it seems a bit expensive with just a few features but we gave it only because it works so well with 4.3 stars out of 5 stars. 3. Temperature electric remote control with LCD display, the third choice is the thermostatic LCD universal remote control. The cool temperature control included with this remote control turns the fan on/off at the temperature you set. This is an energy-saving one because it reduces the speed of the fan when the room reaches the desired temperature. However, you will pay a little more for this feature. The cost of the remote is reasonable and if it becomes a universal remote, it will be suitable for the Hampton Bay model. Sometimes the fan turns on itself and at a set temperature, in addition to working well on a good and easy display and self-adjusting speed. Another feature that it does not have is the reverse blade button, which is semi-important to me during the winter months. If this is not an issue, this is a good replacement remote control. This ceiling fan remote has 4.2 stars out of 5 stars. 4. Wink Support Universal Ceiling Fan Premier Remote Control Wink Activation Universal Remote Control This wink-enabled Hampton Bay 4 single-range remote control is compatible with WINK automation system that allows you to control the ceiling fan via smartphone or tablet. Features a light/fan timer and comfort breeze settings. This setting randomly changes the speed of the ceiling fan to create a 'wind' effect in the room. You pay for all these add-ons at $49.99! However, if the ceiling fan is not on the switch, pairing with a wink will not be an easy time. To use the pairing process, you must turn it off. I installed the remote control and called the customer support number and took this unfortunate lesson after spending an hours on the phone. I had to go through the process of connecting a temporary switch between the ceiling fan and the power line so I could pair it with a wink. The switch then had to be removed and the ceiling fan re-assembled. After cutting the slots in the canopy and then mounting the antenna as externally as possible, is now in a steady connection and online. If I had known all this in advance, I would have given it a higher rating. However, to be fair, for most people the installation will be much easier than it is for me. It offers a total of 3.9 stars out of 5 stars, and a total of 74% of purchasers recommend this remote control. 5. Universal Hampton Bay Ceiling Fan Thermostatic Remote Remote Universal Thermostat Remote Control The last Hampton Bay remote control we recommend is this stylish Thermostatic remote control. The design is almost universal, making it compatible with most ceiling fan brands. This includes Hampton Bay, Hunter and more. Overall, we found that this ceiling fan remote kit is a good item. The kit is very easy to install even for those who can be electric seconds. If you can match colors, you can install a receiver. The remote control buttons are very intuitive, but users with no wiring experience should read the orientation thoroughly and not perform the installation if they are not familiar with the wiring.
