Scout: Palais-Srujana Chandrasekar, 53, a landless laborer, who has worked in the brick industry since his childhood, operated low-cost manual brick manufacturing machines to reduce drudgery in the process. Chandrasekar, who was in the background, was born into a farmworker family. He had to drop out of school after third grade due to a tuberculosis infection and never returned. The family's poor financial condition made him work. Since then, he has worked as an agricultural worker, porter, and in the brick manufacturing industry, where he spent the longest time there. Despite the economic challenges, he had to be creative and innovative throughout his life. He created a manually operated sugarcane grinder and a manually operated nom oil extractor. He is married and has three children. In the Genesis brick industry, work is assigned according to gender. Men are engaged in bringing raw materials, and women are engaged in making bricks by sitting with chairs on small pieces of stone. Sitting and working in a squat position often causes women's body parts to be exposed, sometimes leading to harassment in a mixed gender work atmosphere. Witnessing many of these cases, Chandrasekar decided to make a machine that would reduce drudgery and allow it to make bricks without the demand of sitting down. He designed machines without power requirements so that people don't have to rely on electricity for their work. Frequent power outages in the village would not have helped if it were an electric operating machine. Chandrasekar recalls that there was no one to support him in the early stages of his innovation development. Gradually his family realized the importance of the machine and began to encourage him. But he expresses dismay at the society's response to his initiative. He says he suggested people look for jobs to make money rather than develop machines. When he was able to build the machine, people still thought about why labor would become a scientist and he didn't want to do what he had to do. If no one had financial support, slowly he was able to prototype a brick-making machine himself. But the most bitter experience of his life happened. The prototype was stolen by someone. He put all his resources into creating the prototype, so it was already difficult to make ends meet because he didn't have any money left to make anything else. During this time, Chandrasekar was supported by the Palle Srujana, followed by support from NIF and the development of prototypes. Brick making machine This is a manual brick manufacturing machine that has mechanized the pressing process to remove molding, excess mud and improve productivity. This machine does not have to sit continuously in an awkward position, standing. Device In addition to reducing druggers in this way, productivity can be increased by nearly three times that of conventional methods. You can make 50 bricks at a time compared to other brick manufacturing machines that make 10-15 bricks at a time. Conventionally, a team of six can build 1500 bricks in 8 hours, earning 1000-1500Rs. The machine also requires a team of six workers for operation, but the high productivity of the machine helps to earn more, such as Rs.4000-5000 for 8 hours. Another social advantage of the machine is that due to its design, child labor cannot be involved. The first prototype he developed weighed about 300 kilograms and was reduced to 120 kilograms in the second prototype. Chandrasekar is still working to retrofit machines, reduce weight and further improve efficiency so that they can be given to people for a living. Balaji Corporation is a renowned manufacturer and supplier of manual concrete bricks making machines in India. The machine is equipped to provide high quality, long tonability and top-notch blocks. Zero emission and dangerous release of dangerous gas, this machine is well disposed of condition. Spec PAN mixer: diameter 6 feet capacity: 300 K.G. Material manual discharge: floor door opening and closing (manual) mixing: by heavy rollers and hard face scrapers. Manual press: Pair press production capacity: 1000 blocks per hour: 230 x 110 x 75 mm Power unit: 12 H.P. air-cooled diesel engine or 10 H.P. electric motor. The raw material in the production process is stirred in a dish mix with water. The prepared blend must be pressed in its own loader East Sea physically. The press has a unique shape to make different states of squares and blocks. This press is added to the force unit. By this plant, we can provide strong blocks, hollow squares from solid materials. The execution of other detail requests is affected after receiving the purchase order from the side, along with the semi-development insanity. Transportation of plant devices executed 30 days after the purchase date. The speed of the factory is all factories. The cost of the entire plant can fluctuate for universal buyers with trade rates. Transportation and other charges are added. We also manufacture and supply packaging machines, etc. Please write to us at +91 – 99984 02333 or balajiinc1997@yahoo.com our products/services.
